## Appendix I: Whirlwind Jack Property Claims

### Abbreviations and Units of Measurement

UTM	Universal Transverse Mercator		in	Inch(es)
Au	gold		Kg	Kilogram(s)
%	Percent		m	Metre(s)
<	Less than		Ma	Million years ago
>	Greater than		m <sup>2</sup>	Square metres
cm	Centimetre		mm	Millimetre(s)
Cu	copper		NI 43-101	Canadian National Instrument 43-101
DDH / ddh	Diamond drill hole		P.Geo.	Professional Geoscientist
IP	Induced Polarization		ppb	Parts per billion
GPS	Global positioning system		ppm	Parts per million
ha	Hectare(s)		QA	Quality Assurance
ICP-AAS	Inductively coupled plasma atomic absorption spectroscopy		QC	Quality Control
ICP	Inductively coupled plasma		QP	Qualified Person

## **DATE and SIGNATURE PAGE**

This report titled “Technical Report on the Whirlwind Jack Property, Red Lake Mining Division, Northwestern Ontario”, and dated March 1, 2020 was prepared and signed by the following Author:

Dated at Thunder Bay, Ontario  
March 1<sup>st</sup>, 2020

“Desmond Cullen”

“J. Garry Clark”

Desmond Cullen, P.Geol.

J. Garry Clark, P.Geol.

“Matthew Long”

Matthew Long, P.Geol.

**Item 1: Summary**

Clark Exploration Consulting, of Thunder Bay, Ontario was contracted by Red Lake Gold Inc. ("Red Lake Gold"), to review historic data for their Whirlwind Jack Property (the "Property"), identify its merits, propose an appropriate exploration program and budget for gold exploration on the property, and prepare a Form 43-101F1 Technical Report (the "Report") compliant with NI 43-101 *Standards of Disclosure for Mineral Projects* ("NI 43-101") and suitable for inclusion in a prospectus document for the purposes of a financing or listing application by Red Lake Gold.

The property comprises a total of 1042 active Single Cell Mining claims, with Red Lake Gold Inc. the registered holder (100%). The total area of the Property is 21,238 hectares. The claims are located 10 km. south of the municipality of Red Lake, within the Red Lake Mining Division. The approximate centre of the Property is at UTM Zone 15N NAD83 co-ordinates 15439800E 5639000N, NTS map sheet 52K/13. The claims are located in the Dedee Lake, Rainbow Lake, Medicine Stone Lake and Faulkenham Lake Administrative areas, of North-west Ontario.

The property area is located in the western portion of the Uchi Subprovince, a region comprising two major greenstone belts, Red Lake and Birch-Uchi. The Property lies adjacent to and immediately west of the Dixie Project of Great Bear Resources Ltd.

The Whirlwind Jack Gold Project is a district-scale gold exploration project, and is viewed as sharing similar greenstone and geologic assemblages as the contiguous Dixie Gold Project being advanced by neighbouring Great Bear Resources.

In addition to significant geological likeness, past airborne geophysical work covering the Whirlwind Jack Gold Project has defined a similar and continuous geophysical footprint akin to the adjacent Dixie Project, with a long-length, arcing, magnetically disrupted trend visible across both properties.

Past exploration work at the mid-point of the Whirlwind Jack Gold Project has identified the presence of gold, including a historical grab sample of 7 g/t Au (see Mineral Deposit Inventory of Ontario, No. MDI52N04SE00057).

The Dixie property of Great Bear Resources hosts two principle styles of gold mineralization:

**High-grade gold in quartz veins and silica-sulphide replacement zones (Dixie Limb and Hinge).** Hosted by mafic volcanic rocks, and localized near regional-scale D2 fold axes. These mineralization styles are also typical of the significant mined deposits of the Red Lake district.

**High-grade disseminated gold with broad moderate to lower grade envelopes (LP Fault).** Interpreted to traverse the Dixie property for approximately 18 kilometres of strike length and currently drilled along 4 kilometres of strike length. High-grade gold mineralization is controlled by structural and geological contacts, and moderate to lower-grade disseminated gold surrounds and flanks the high-grade intervals. The dominant gold-hosting stratigraphy consists of felsic sediments and volcanic units.

At the Dixie Project, gold mineralization is confirmed along a 2.3 km strike of a 10 km target. The system at the Dixie Project has a high-grade gold zone that includes recent intervals of 16.35 metres of 26.91 g/t gold and 7.00 metres of 68.76 g/t gold and is open along strike and at depth.

The Authors have been unable to verify this information, and the information is not necessarily indicative of the mineralization on the Whirlwind Jack Property that is the subject of this Report.

Prospecting work performed by Red Lake Gold covered an assessment of lithology, stratigraphy, terrain and cover to determine the viability of a more extensive and comprehensive mapping and geochemical sampling programme. Traverses used handheld GPS for navigation. A total of 28 samples were taken, with all analysed for Au and a multi-element (ICP) package. The majority of samples returned less than 5 ppb Au, with one returning 24 ppb Au.

Further prospecting and mapping on the Property is recommended to examine areas and targets in part defined by the airborne magnetic survey. This work should be followed up by soil geochemistry surveys over target areas determined by the above prospecting and mapping, as well as targets defined by the magnetic survey where outcrop is not found.

Induced Polarization (IP) surveys should be conducted over areas defined by the combined work discussed above, followed by diamond drilling on selected targets defined by all of this work

**Item 2: Introduction**

Clark Exploration Consulting, of Thunder Bay, Ontario was contracted by Red Lake Gold Inc. (“Red Lake Gold ”), to review historic data for the Whirlwind Jack Property (the “Property”), identify its merits, propose an appropriate exploration program and budget for gold exploration on the property, and prepare a Technical Report (the “Report”) compliant with NI 43-101 and suitable for inclusion in a prospectus document for the purposes of a financing or listing application by Red Lake Gold. The report and recommendations are based on:

1. Public data archived with the Ontario Ministry of Energy, Northern Development and Mines.
2. Exploration records provided by Red Lake Gold.
3. A personal site visit by the independent author Matthew Long to the Property on January 30, 2020.

The property comprises a total of 1042 active Single Cell Mining claims, with Red Lake Gold Inc. the registered holder (100%). The total area of the Property is 21,238 hectares. The claims are located 10 km. south of the municipality of Red Lake, within the Red Lake Mining Division. The approximate centre of the Property is at UTM Zone 15N NAD83 co-ordinates 15439800E 5639000N, NTS map sheet 52K/13. The claims are located in the Dedee Lake, Rainbow Lake, Medicine Stone Lake and Faulkenham Lake Administrative areas, of North-west Ontario.

The property area is located in the western portion of the Uchi Subprovince, a region comprising two major greenstone belts, Red Lake and Birch-Uchi. The Property lies adjacent to and immediately west of the Dixie Project of Great Bear Resources.

**Item 3: Reliance on Other Experts**

For the purposes of this report the Author has relied on ownership information provided by Red Lake Gold, as well as claim information available on the website of the Ontario Ministry of Energy, Northern Development and Mines (MENDM). The Author has not researched property title or mineral rights for the Property and expresses no opinion as to the ownership status of the Property. The claim information from the MENDM website is current as of the effective date of this Report.

#### Item 4: Property Description and Location

The property comprises a total of 1,042 active Single Cell Mining claims, with Red Lake Gold Inc. the registered holder (100%). The property is subject to a 2% gross royalty. The total area of the Property is 21,238 hectares, and the claims data is listed in Appendix I of this Report.

The claims are located 10 km. south of the municipality of Red Lake, within the Red Lake Mining Division, (Fig. 1). The approximate centre of the Property is at UTM Zone 15N NAD83 co-ordinates 15439800E 5639000N, NTS map sheet 52K/13. The claims are located in the Dedee Lake, Rainbow Lake, Medicine Stone Lake and Faulkenham Lake Administrative areas, of North-west Ontario.

The proposed exploration program in this report is subject to the guidelines, policies and legislation of the Ontario Ministry of Energy, Northern Development and Mines ("MENDM"), Ontario Ministry of Natural Resources and Federal Department of Fisheries and Oceans regarding surface exploration, stream crossings, and work being carried out near rivers and bodies of water, drilling and sludge disposal, drill casings, capping of holes, storage of core, trenching, road construction, waste and garbage disposal.

The Ontario Mining Act requires Exploration Permits or Plans for exploration on Crown Lands. The permits and plans are obtained from the MENDM. The processing periods are 50 days for a permit and 30 days for a plan while the documents are reviewed by MENDM and presented to the Aboriginal communities whose traditional lands may be impacted by the work. The Author recommends the company discuss the recommended exploration with the MENDM to determine the plan and/or permit required as well as the Aboriginal communities to consult. The necessary Permits have been obtained by Red Lake Gold .

The government of Ontario requires expenditures of \$400 per year per cell for staked claims, prior to expiry, to keep the claims in good standing for the following year. Boundary claims (i.e. claims where the new cell was covered by more than one owner) require expenditures of \$200 per year. The Assessment report describing the work done by the company must be submitted by the expiry date of the claims to which the work is to be applied.

No mineral resources, reserves or mines existing prior to the mineralization described in this report are known by the Author to occur on the Property. There are no known environmental liabilities associated with the Property, and there are no other known factors or risks that may affect access, title, or the right or ability to perform work on the Property. The mining claims do not give the claim holder title to or interest in the surface rights on those claims, and as the land is crown land, legal access to the claims is available by public roads which cross the Property.

### **Item 5: Accessibility, Climate, Local Resources, Infrastructure and Physiography**

The Property is located approximately 10 km south of the Red Lake Municipality of northwestern Ontario, approximately 565 km by road (430 km direct) northwest of Thunder Bay and approximately 475 km by road (260 km direct) east-northeast of Winnipeg, Manitoba. Red Lake can be reached via Highway 105 from the Trans-Canada Highway 17. Red Lake is also serviced with daily flights from Thunder Bay and Winnipeg.

Access is afforded by float-plane to several lakes on the property, with ground access by trails or cross-country to northern and eastern portions of the block, and vehicle access to the south-east portion of the block using the Dixie Lake road, off Highway 105.

The majority of the property can be accessed by boat with several portages providing access between several of the larger bodies of water. Creeks are generally shallow, providing limited navigation. There are also several skidoo trails in the area under investigation, but their overall suitability is unknown.

The Red Lake Municipality, with a population of approximately 5,000, comprises six communities: Red Lake, Balmertown, Cochenour, Madsen, McKenzie Island, and Starratt-Olsen. Mining and mineral exploration is the primary industry in the area, with production mainly from Newmont's 3100 tonne/day Red Lake gold mine. Other industries include logging and tourism. The Municipality of Red Lake offers a full range of services and supplies for mineral exploration and mining, including both skilled and unskilled labour, bulk fuels, freight, heavy equipment, groceries, hardware and mining supplies.

Power is available from Red Lake, and there is also a generating station at Ear Falls, approximately 70km south of Red Lake, with the power line running along Highway 105. The current land holdings are sufficient to allow for exploration and there are currently no encumbrances on surface rights on the Property.

The terrain is fairly typical for the Pre-Cambrian of north-west Ontario, with low rolling hills and swamp/marsh. Property elevation ranges from 388 to 435 metres above sea level ('asl'). Natural vegetation has been dramatically modified by logging, dating back nearly 100 years, periodic fires (notably the Red Lake fire of 1980), several infestations resulting in near complete loss of mature balsam, and more recently jackpine budworm. Storms and associated microbursts have caused local, significant blow down. Hill tops are generally clearer, with relict jackpine predominant; otherwise, the area now supports a mixed bush of spruce, poplar, pine, birch and alders with almost no old growth remaining.

The climate is classified as boreal, (Dfc under the Koppen classification system). Red Lake climate data (eldoradoweather.com), indicates minimum and maximum daily average temperatures of, respectively, -19.6° C. and 18.1° C, maximum average snow depths of 33.4 cm (January) and maximum rainfall of 87.3 mm (June).

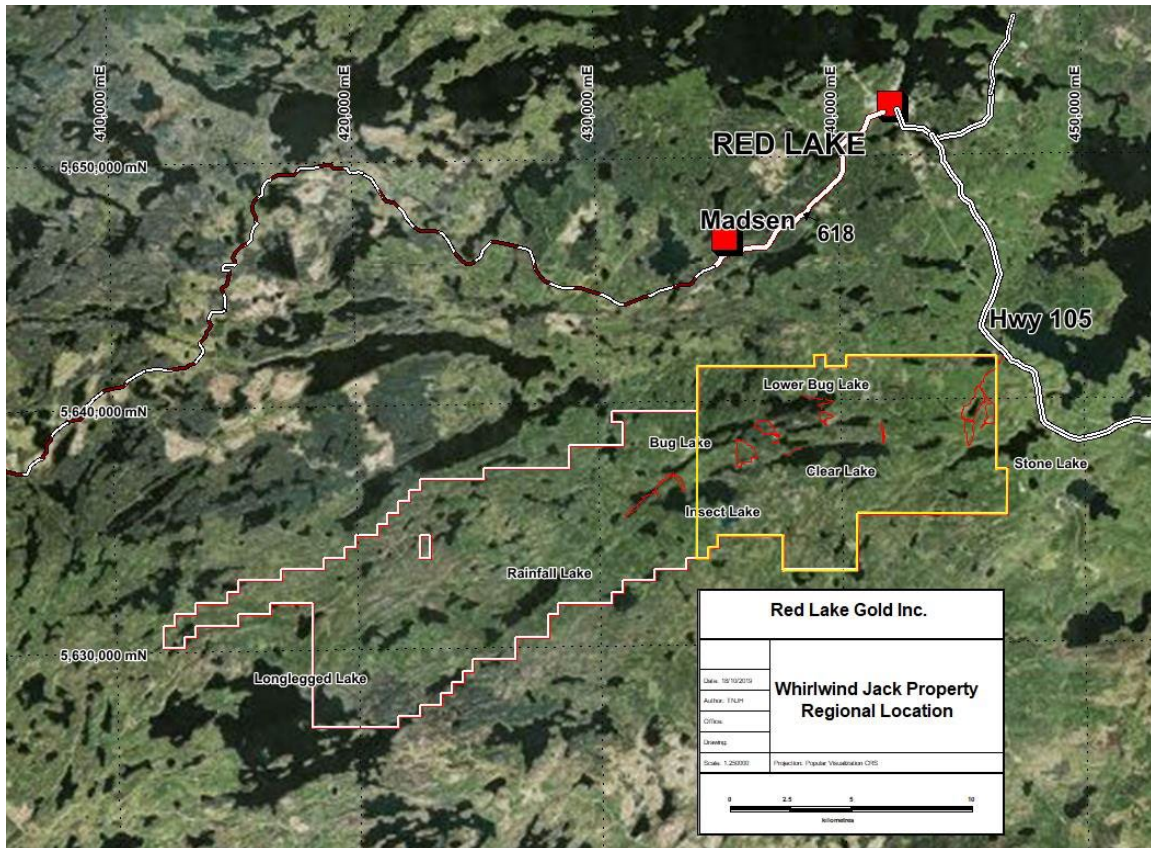

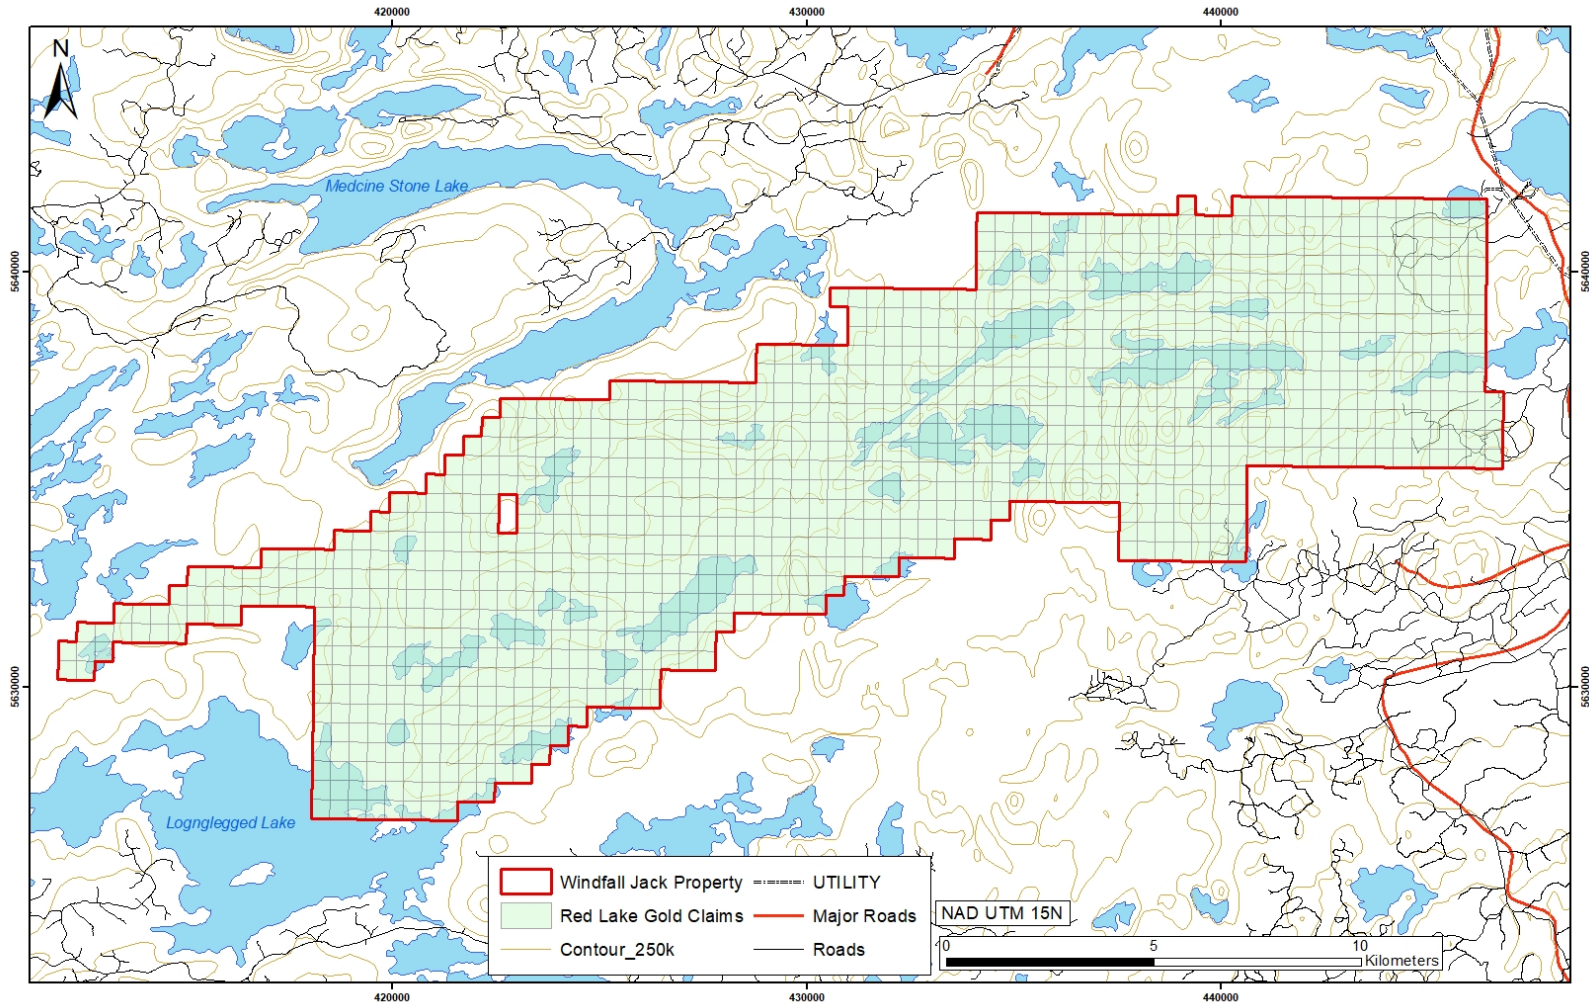

Figure 2. Whirlwind Jack Property Claims

**Item 6: History**

Past exploration work at the mid-point of the Whirlwind Jack Gold Project has identified the presence of gold, including a historical grab sample of 7 g/t Au (Mineral Deposit Inventory (MDI) of Ontario, No. MDI52N04SE00057). The gold occurrence is called Alcock-Bug Lake which is illustrated on an Ontario Geological Survey 1975 preliminary map and was credited to have been first reported in 1946 (Figure 4).

**1973:** Selco Mining Division in partnership with Cochenour Willans Gold Mines and Coin Lake Gold Mines, carried out reconnaissance and grid mapping in the Longlegged-Rainfall lakes area in the south-west of the Whirlwind Jack claims, this as part of several programmes executed in their Sydney Lake Project. A number of sequences of open to tight folded ortho-, paragneiss, iron formation, amphibolite and pyroxenite, granite gneiss, granite, diorite and migmatite were mapped. Minor, poorly documented pyrite, pyrrhotite, magnetite and molybdenite mineralisation was noted. A single X-ray drill hole, L73-7-1, was shown on Claim Group 7, East of Rainfall Creek, between the two major expanses of Longlegged Lake, (and West of Dedee Lake), but the report provides no other information. The drill hole appears to have targeted pyrite-pyrrhotite mineralised amphibolite (gneiss).

**1973:** Selco Mining Division (Cochenour – Coin – Selco) drilled six holes for a total of 923 feet, as follows:

Group 3 LL-73-3-1 122 feet  
Group 3 LL-3-73-2 172 feet  
Group 5 LL-5-73-1 174 feet  
Group 7 LL7-73-1 174 feet  
Group 10 LL-10-73-1 175 feet  
Group 11 LL-11-73-1 106 feet

Varying amounts of weak, trace to stringer pyrrhotite-pyrite were intersected, usually within amphibolite gneiss. Very minor sampling was reported, but no assays.

**1974:** Selco Mining Division (Cochenour – Coin – Selco) drilled two holes, numbers LL -2 -74 -1 and -2, on Longlegged Lake Group 2, claim KRL 357253. Hole 1 was drilled to a depth of 347 feet, hole 2, 209 feet. Pyrite, pyrrhotite, trace chalcopyrite and magnetite mineralisation were intersected in amphibolite (orthogneiss). No assays were reported. Another hole was drilled LL-4-74-1 on Group 4 claim, (KRL 357057), this to a depth of 279 feet. Disseminated and 'blebby' pyrrhotite and trace pyrite in paragneiss was intersected but no assays reported.

A single hole, LL-9-74-1 on Group 9 was drilled to a depth of 353 feet. Apparently, it tested a conductor, described as 30-40% mainly pyrrhotite, minor pyrite and

occasional chalcopyrite over 0.7 feet. Sampled, no assays were reported from the hole which intersected paragneiss throughout.

A single hole, 128-foot hole, LL-17-74-1, was drilled on their Group 17 Block. Amphibolite gneiss, pegmatite, mylonite and feldspar-biotite gneiss were intersected. Results were not reported. The location was reported as Insect Lake, but no map was provided in the file. The Google Earth MNDM drill hole database has no location nearby, and the claim block is shown 1.2 km to the South. It appears the hole targeted a MaxMin EM anomaly.

**1976:** Selco conducted geophysical surveying on their Block 150 – 6, Dixie Lake area, located in the south-west quadrant of claim sheet M-2146, Faulkenham Lake. The Block covers ground immediately South of Bug Lake, extending East to the East end of Lower Bug Lake, and as far South as the North shore of Clear Lake. A Geonics E.M. 17 horizontal loop unit with 400 ft coil separation using a frequency of 1600 cps (cycles per second), and a McPhar M-700 magnetometer were used. Several conductive zones were noted, with one considered to be caused by a bedrock conductor, and recommended for drilling. This conductor, trending around 080°, appears to be partially co-incident with anomalous MMI results and siliceous pyritic float later recorded by Precambrian Ventures (see below).

Similar geophysical surveying was completed on their 150 – 5 claim block, located in the south-east quadrant of the same map sheet. One strong in-phase anomaly with a very high direct magnetic correlation was noted on lines 1200W and 1600W, at approximately 300 ft. North. It was suggested it represents a (magnetic) iron formation, and a recommendation was made to drill this feature. Some ground investigations indicate the conductor may lie near a dacite-mafic volcanic contact. The grid is located immediately South of an elongate East-West wider portion the Bug Lake river, with access by a cut trail from Stone Lake, approximately 1 km to the south-east. Other grids were cut, 150 – 10, 150-11 with similar surveying thereon. Block 150 – 11 is located less than 400 metres South of an irregular isosceles triangular shaped (North-South) lake, a little over 1.2 km North of the West end of Stone Lake, and over 400 metres East of Block 150 – 5. An East-West trending conductive response was recorded, but a bedrock source could not be determined. Access was afforded by a cut trail North of Stone Lake, and a series of old logging roads leading West off Highway 105 at Stone Lake.

Block 150 – 10 is located just North of the Whirlwind Jack property.

**1985:** Aerodat Limited, on behalf of Golden Terrace Resources, flew a combined helicopter-borne magnetic and VLF-EM survey in the Dixie Lake Area. The survey covered an area from Bug Lake in the West, eastwards across Clear and Stone Lakes, North of Genessee Lake and over to Tote Road Lake, north-west of Pakwash Lake, West of Highway 105.

A series of 'lenticular' magnetic high features were outlined, and 13, possibly 14 conductors identified. These magnetic trends run along the 'long axes' of the west and centre blocks, with smaller and broader features considered to be late-stage intrusions.

**1990:** Noranda Exploration Co. Ltd. Staked 28 claims to cover a weak airborne EM-magnetic feature and carried out a geological survey. The area is located between Genessee and Pakwash lakes on what is currently the easternmost portion of the Whirlwind Jack property, extending eastwards.

The company mapped an east-west striking sequence of mafic and felsic volcanic rocks flanked to the North and South by felsic plutons. Massive and pillowed flows were mapped, plus flow-banded rhyolite and tuff. Metamorphic grade is amphibolite, with moderately well-defined gneissic texture developed. Several felsic dykes of granite, aplite and feldspar porphyry were reported to cut this sequence, and 'weak shearing' noted at several locales. The EM conductor was concluded to be coincident with the felsic-mafic volcanic contact and a soil geochemical survey was recommended. No lithological sampling was reported.

**1995:** Inco Exploration and Technical Services Inc. conducted a multi-disciplinary exploration programme on their Loydex Resources Inc. option, aka Bug River property. The property was located immediately North of what is now the far north-east corner of the Whirlwind Jack claims, with a small overlap to the South.

The property covered a "newly discovered intense hydrothermal alteration zone within quartz phyrific felsic volcanics. The alteration is spatially associated with a zone of massive pyrrhotite-pyrite." (From the Inco report). Gridding, geological mapping, and geophysical surveys (magnetometer and EM-57) and diamond drilling were carried out, but results were negative, with the sulphide zone hosting no (appreciable) copper and zinc. The option was dropped, however, there is no mention of the gold potential. The single drill hole, number 79841 was drilled less than 250 metres from Bug River, West of the Highway and the exit of the river into Gullrock Lake. The log reports no massive sulphides, only minor pyrite in felsic volcanic rocks, ICP analyses but no gold assays. The report also shows two Noramco diamond drill holes numbers NB-88-09 and -10 located respectively, approximately 250 and 725 metres North and north-west, of Bug River. Inco analyses included re-sampling of some of the Noramco core.

**1998:** Noranda Exploration Co. Ltd. Continued work on their Bug River Project, with geological mapping, diamond drilling and borehole TEM ('Transient electromagnetic) Surveying (Smith 1999). The property essentially covered the Loydex option, though extending farther South onto what is now the north-eastern corner of the Whirlwind Jack property. The first phase focussed on sulphide mineralisation associated with iron formation, culminating with the drilling of two holes, BR98-1, and 98-2, the former intersecting said mineralisation, this on the Bug Lake West Grid, North of Bug River. The company considered the property to cover

the western strike extension of the Dixie area felsic volcanic sequence, Dixie 17, 18 and 19 and Joy Copper-Zinc occurrences in the Birch-Uchi greenstone belt.

The Phase II drilling comprised the completion of eight holes, BR98-2 to 98-10, for a total of 2,330 metres, intersecting a volcanic sequence of massive to pillowed mafic flows and massive to porphyritic intermediate to felsic volcanic, mainly pyroclastic rocks. Mineralised, often stringer pyrrhotite-pyrite quartz-sericite schist, magnetic mafic intrusion, and minor narrow massive to semi-massive sulphides were intersected in several holes. Five holes, numbers 1,2,3,4 and 7 were surveyed with a borehole Pulse TEM system. The poor base metal and precious metal (gold and silver results), and weak EM responses prompted the company to drop the option.

**2004:** Grandcru Resources Corporation performed magnetic surveying and 32.7 line km of Horizontal Loop E.M. ('HLEM') surveys on their Clear Lake property, Faulkenham Lake area (Bowdidge 2004). The following descriptions are summarized from the Bowdidge (2004) report. The magnetic survey defined a group of more or less linear, discontinuous anomalies that co-inside, on a gross scale with the conductive trend that crosses the grid. The strongest of these anomalies has a peak magnetic amplitude of 2500 nT (gammas). This trend lies close to the volcanic-sedimentary contact as mapped by Thurston & Paktunc (1985). To the South of this trend/contact, within the volcanic terrain, the magnetic pattern is quite flat, with a few isolated magnetic highs with amplitudes up to 1000 nT.

In the area underlain by metasediments north of the conductive/magnetic trend, the magnetic pattern is much more active. There are numerous erratically distributed magnetic highs, a few of that are linear and are presumed to be caused by formational units. The number and intensity of these anomalies increase progressively from east to west.

In the northwest corner of the grid, presumed to be underlain by granodiorite, the magnetic pattern is again quite flat.

The horizontal loop survey shows four separate conductors, which line up to form a more or less continuous trend along the volcanic-sedimentary contact. There is a possible structural disruption in the vicinity of line 700W, where the magnetic-conductive trend may be offset by 100 to 150 metres.

Conductor A is 950 metres long, and is mostly narrow, with a section up to 60 metres wide between lines 1200W and 1500W. Apparent conductance is between 2 and 27 siemens. There is an irregular magnetic response, with alternating highs and lows, suggestive of concentrations of pyrrhotite.

Conductor B is 200 metres long and up to 25 metres wide, with apparent conductance of up to 23 siemens. The magnetic response again features highs and lows.

Conductor C is 150 metres long and is up to 15 metres wide, with much lower conductance, up to 6 siemens. It has no magnetic association.

Conductor D has been traced for 1400 metres and extends beyond the east end of the grid. It is very weak, and conductance calculations derived from in-phase/quadrature ratios would suggest a moderately good conductor at considerable depth, which would probably be misleading.

It is probably narrow, but the amplitudes are so low that widths cannot be reliably measured. It loosely follows a number of magnetic anomalies, but it tends to flank them.

Grandcru concluded most if not all the conductors followed the trend of a mafic volcanic-clastic sediment contact trending east north-east, and recommended grid mapping, re-locating mineralised (pyritic) boulders described by Thomson (1946) and a single drill hole reported by Thurston and Paktunc (1985).

**2009:** Precambrian Ventures Ltd. On behalf of Precambrian, Mount Morgan Resources Ltd carried out a Mobile Metal Ions (MMI) geochemical survey over a portion of their Alcock property, (re-naming the property previously held by Grandcru), located just South of the eastern portion of Bug Lake (Campbell 2009). A total of 368 inorganic and organic samples were collected with a view to delineating precious and base metal anomalies. A number of 'high-contrast base metals anomalies were identified, though the majority were spatially restricted, single and multi-sample responses that are often restricted to one sampling transect. One high contrast gold anomaly was identified as spatially related to pyritic, siliceous boulders, and the HLEM conductor defined by Grandcru's survey apparently had no significant MMI response.

**2010:** Precambrian Ventures continued exploration with a programme of prospecting, rock sampling and a follow-up MMI survey (Campbell 2010). Focus was on prospecting on and around siliceous boulders just West of Alcock Lake. Sampling of these and more float closer to the shoreline, returned no significant precious metal values. The report recommended prospecting a cluster of airborne EM anomalies in the western part of the property, where metasedimentary and iron formation rocks are apparently exposed. Additional work was recommended to the north-west along a high strain zone identified by past government work, located just South of Bug Lake (Muir, 1994).

The report mentioned anomalous base metal values in soils should be targeted for follow-up, but evidential material is lacking.

## ITEM 7: GEOLOGICAL SETTING AND MINERALIZATION

### 7.1 Regional Geology

The property area is located in the western portion of the Uchi Subprovince, a region comprising two major greenstone belts, Red Lake and Birch-Uchi (Figure 3).

#### Red Lake Greenstone Belt ('RLGB')

The Belt comprises a series of ca. 2.99–2.70 Ga supracrustal rocks and three main granitoid batholiths. A brief description of the major units follows (Dubé et al, 2004). The prefix, 'meta' (metamorphosed) is excluded. Ga = 'billion years'.

The Red Lake greenstone belt is part of the Uchi subprovince of the Superior province. The greenstone belt is dominated by Mesoarchean (marine-deposited, tholeiitic basalt to komatiitic) volcanic rocks of the Balmer assemblage (2.99–2.96 Ga) with intercalated felsic and ultramafic intrusive and extrusive rocks and turbidites, volcanoclastic rocks and iron formations. The Ball assemblage (2.94–2.92 Ga) comprised of intermediate to felsic calc-alkaline flows and pyroclastic overlies the Balmer assemblage.

Unconformably overlying the Balmer and Ball assemblages are the Slate Bay assemblage (2.916 Ga) (clastic rocks dominantly, conglomerates, quartz-rich arenites, wackes, and mudstones) and the Bruce Channel assemblage (2.894 Ga) (clastic sedimentary rocks and banded iron-formation) (Sanborn-Barrie et al., 2004).

The unconformity is locally draped by polymictic conglomerate that gives way to a Neoarchean volcanic succession, including calc-alkaline and tholeiitic volcanic rocks of the Confederation assemblage (2.75 to 2.73 Ga) and calc-alkaline rocks of the Graves assemblage (2.732 Ga). Polymictic conglomerate and finer clastic sedimentary rocks of the Huston assemblage separate the Confederation and Graves assemblages on the North shore of Red Lake. In the vicinity of the Red Lake mine, the conglomerate of the Huston assemblage rests unconformably on a substrate of supracrustal rocks of the Balmer and Bruce Channel assemblages (Sanborn-Barrie et al., 2001, 2002).

Post- Confederation assemblage formation, the Huston Assemblage (2.742 and 2.733 Ga), records a period of clastic sedimentary deposition characterized by immature conglomerates to wackes.

The Graves Assemblage comprises andesitic to dacitic pyroclastic tuff on the north shore of Red Lake and is interpreted to represent volcanic deposits in a shallow water to subaerial arc complex setting. It overlies and is locally transitional with the Huston Assemblage.

The Trout Bay Assemblage, located in the north-west of the RLGB, was previously correlated with Balmer rocks but is now considered to represent a distinct sequence. It comprises tholeiitic basalt, clastic rocks and iron formation, gabbros and ultramafic rocks. An interbedded, intermediate tuff returned a ca. 2.85 Ga age for this assemblage (Dubé et al., 2004, Sanborn-Barrie, 2004).

Four stages of post-volcanic plutonism, at ca 2.74, 2.73, 2.72 to 2.71, and 2.7 to 2.698 Ga, are recorded in the belt, (Dubé et al, 2004). Granitoid intrusions include the McKenzie Island Stock, Dome Stock and the Abino granodiorite (2.72 and 2.718 Ga). Arguably, the last major magmatic event in the RLGB is the post-tectonic Killala-Baird batholith (2.7 Ga).

Two main episodes of deformation (D1, D2) took place after ca. 2742 Ma volcanism (Sanborn-Barrie et al., 2001). The main stages of penetrative deformation produced two sets of folds (F1 and F2). A locally recognized northerly trending S1 foliation is axial planar to north-northeast-trending F1 folds. According to Sanborn-Barrie et al. (2001, 2002), D1 coincided with the deposition of the polymictic conglomerate of the Huston assemblage and preceded the eruption of the Graves assemblages (Sanborn-Barrie et al., 2001). D1 deformation probably occurred between 2742 and 2733 Ma in response to east-directed shortening. A weakly to moderately developed S2-L2 fabric and associated southeast-trending F2 folds are widespread in the eastern Red Lake area where the deposit is located. The main cleavage-forming stage of D2 deformation and associated metamorphism predated 2718 Ma (i.e., the age of the Dome stock), but foliation coplanar with S2 and amphibolite facies metamorphism outlasted emplacement of the Dome stock, indicating that D2 shortening continued beyond its emplacement (Sanborn-Barrie et al., 2002, 2004). Sanborn-Barrie et al. (2004) suggest that D2 strain across the Red Lake greenstone belt occurred between ca. 2720 to 2715 Ma and recorded the collisional stage of the Uchian phase of the Kenoran orogeny (cf. Stott et al., 1989; Stott and Corfu, 1991). Across the RLGB, and elsewhere throughout the Uchi subprovince, the Uchian phase of the Kenoran orogeny was related to collision between the ca. 3.0 Ga North Caribou terrane to the north of the Red Lake greenstone belt and the ca. 3.4 Ga Winnipeg River terrane to the south (Fig. 1). Post-collisional D3 strain is locally recorded in the RLGB after  $2700 \pm 6$  Ma, the maximum age of a deformed and metamorphosed conglomerate near the Madsen mine area that displays a penetrative foliation coplanar with D2 fabrics (Sanborn-Barrie et al., 2004) (Dubé et al., 2004)

## 7.2 Property Geology

There are no records of systematic geological work on the property and published maps are the product of regional mapping by various government workers.

The property geology is shown below in Figure 4.

Southern and western portions of the property are underlain by an extensive sequence of unsubdivided Archaean, medium, locally coarse-grained tonalite and granodiorite, variably foliated to banded, locally migmatitic, plagioclase-hornblende-biotite-quartz gneiss hosting relatively thin, (often less than 100 metres wide) mafic volcanic rocks, amphibolite, other ultramafic rocks, and minor wackes, iron formations and siltstones; all of which are considered to be Archaean age (4.00 to 2.80 Ga) (Hughes 2019).

Much of the North of the property is underlain by Neoproterozoic (2.80-2.50 Ga) quartz monzonite to granodiorite, with local phases of plagiogranite, granite, potassic rich pegmatite and plagioclase-quartz pegmatite. They may appear as relatively homogeneous, massive to lineated to banded, fine to coarse grained, with negligible to considerable amounts of partially to near completely altered to assimilated supracrustal material.

Separating these two major lithological 'domains' is a sequence of generally less altered and deformed, generally East-West trending supracrustal rocks characterized by massive to pillow lavas, related mafic volcanoclastic rocks, intermediate to felsic flows and related pyroclastic and volcanoclastic units, wackes and iron formations. This sequence extends from the eastern boundary of the property, North of Stone Lake, westwards through the Bug Lake-Clear Lake area, and south-westwards, generally following the trend of the centre-west portions of Bug Lake (Hughes 2019). The intermediate-felsic sequence is assigned by e.g. Sanborn-Barrie et al., (2004) to the Confederation assemblage, ca. 2,745-2,735 million years old (Ma), with the sequence extending south-eastwards towards Pakwash Lake, then 'turning' Northeast, North of the Bruce Lake Pluton and the old Griffith Iron Ore Mine near Ear Falls, forming an integral portion of the Birch-Uchi greenstone belt.

### **7.3 Mineralization**

The following discussion of the Property mineralization is taken from Hughes (2019).

Sulphide occurrences in amphibolitised mafic gneisses were noted and explored by Selco in the Dedee, Rainfall and Medicine Stone lakes areas of the property, with several the target of diamond drilling. Documentation on these is scant, with summary notes presented in assessment reports (see "History"). Mineralization was typically noted as disseminated to semi-massive concentrations of pyrite ± pyrrhotite and rarely, very minor chalcopyrite, often in or adjacent to magnetic lithologies (Hughes 2019).

To the East, around Bug Lake, there are several records indicating the presence of variably pyritic, occasionally pyrrhotitic and rarely, copper-bearing metasediments, some of which were described as carbonaceous or iron-rich. Minor disseminated to

veinlet pyrite-chalcopyrite and veined metasediments and intermediate to mafic volcanic-derived lithologies have been recorded near Bug Lake and South to Alcock Lake (Bowdidge 2004). This includes work by Grandcru Resources who partially mapped and prospected in the area, with mineralized float discoveries just West of the West shore of Alcock Lake. The float was discovered as follow-up to investigative work over airborne and ground EM conductors. According to their reports, the area is underlain by iron-rich metasediments or iron formations, but the extent of outcropping mineralization remains unknown.

In the eastern portions of the property, North of Stone Lake, minor disseminated pyrite and chalcopyrite in mafic-intermediate volcanic rock was noted by Hughes (2019). Rocks are poorly exposed and require additional groundwork to fully characterize. There is clear evidence of past exploration in this area, (sample sites), but there are no known records documenting such work.

Associated alteration is typically a combination of actinolite-biotite-chlorite-silica-feldspar-carbonate and magnetite (Hughes 2019). Spatially associated quartz-feldspar veining is common. The effects of the granitoid intrusions are clearly seen across the property, with granitisation or merely, feldspathization of the host rocks, accompanied by small to large scale development of granitoid veining or granite gneiss.

Figure 3. Regional Geology

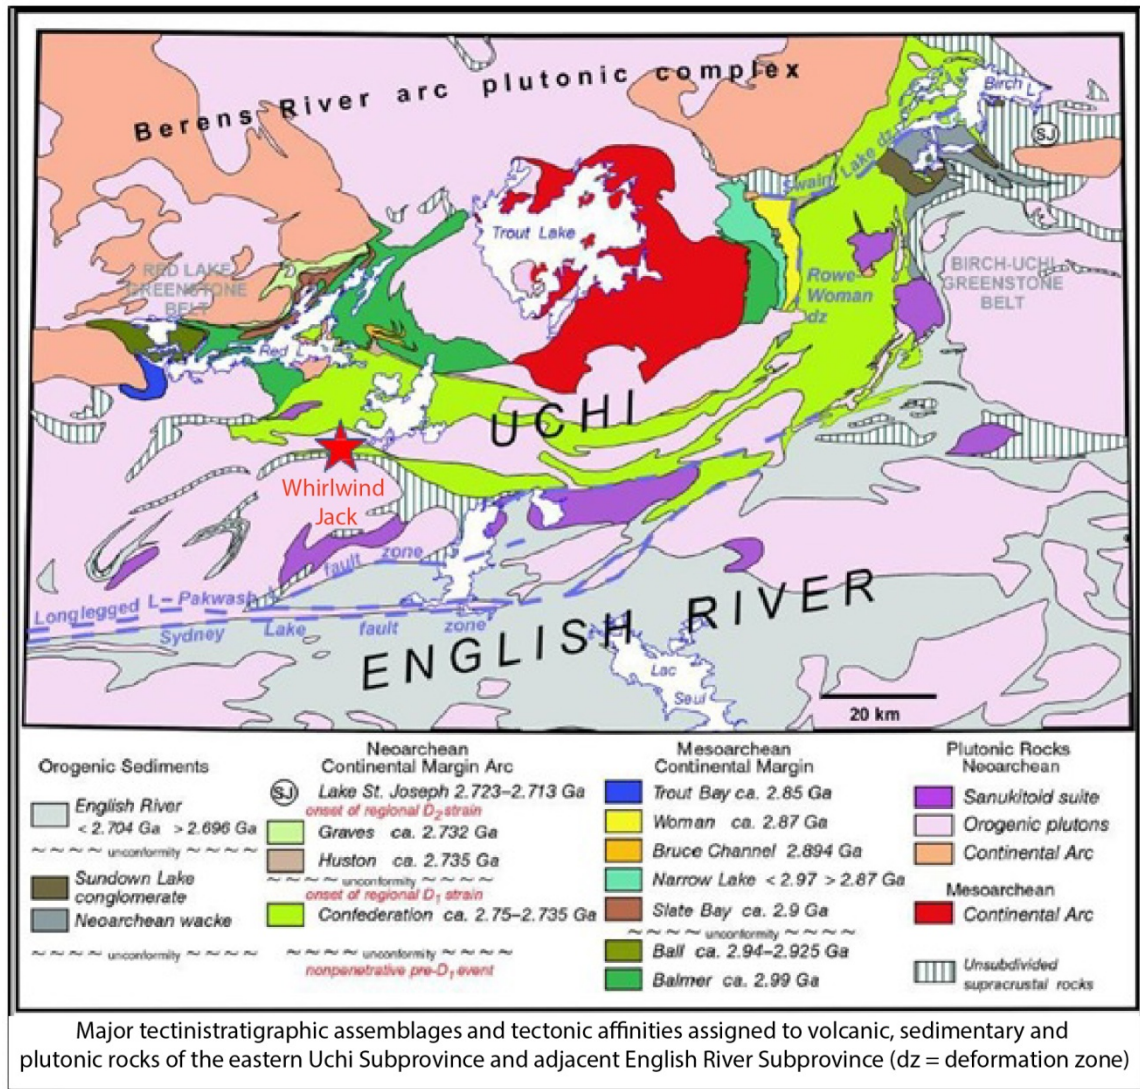

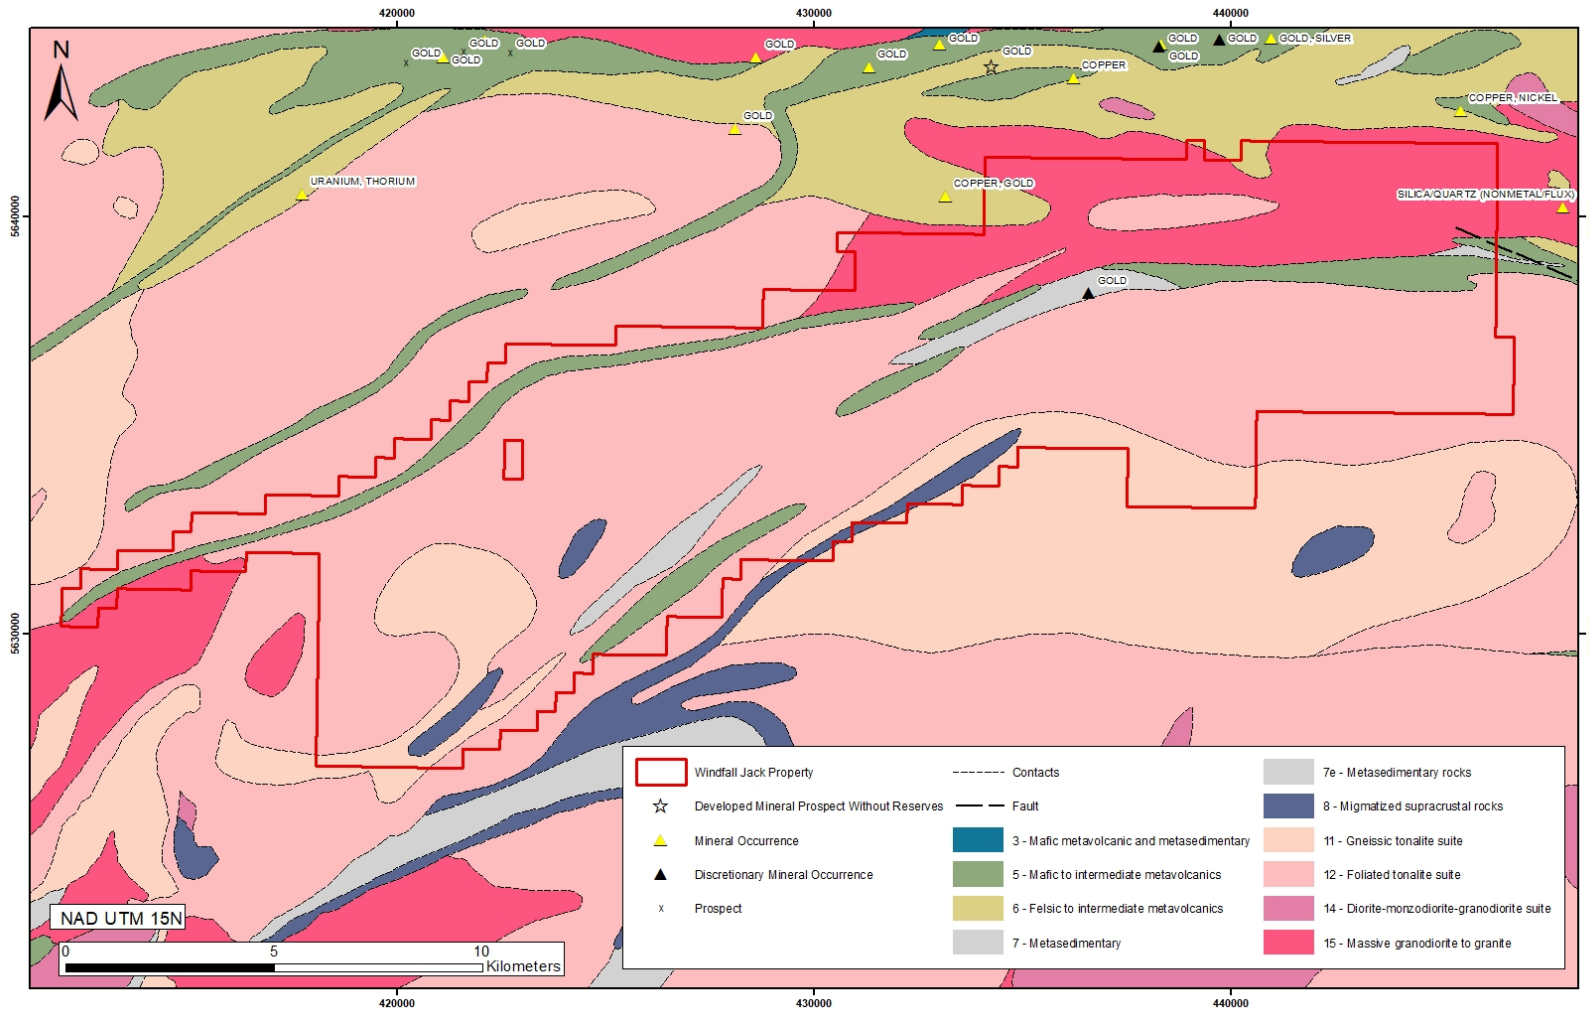

Figure 4. Property Geology

**Item 8: Deposit Types**

The property has been explored for precious and base metals, with the initial focus on identifying volcanogenic massive sulphides, this relating to the South Bay discovery farther East in the Birch-Uchi belt.

Based on a literature review, field observations on the property, and extensive work across the north adjacent Red Lake mining district, and eastwards into the Birch-Uchi greenstone belt, the overall stratigraphy, comprising at least one 'cycle' of poly-deformed, chlorite to amphibolite metamorphic grade, mafic to felsic volcanic rocks, is considered to represent a mesothermal, shear-hosted gold target, with Red Lake mining district an analogue (Hughes 2019).

**Item 9: Exploration**

Following a review of historical property work, related semi-regional geology and exploration, and analysis of regional, airborne geophysical surveying, several areas were chosen for ground truthing and prospecting by Hughes (2019) of Red Lake Gold.

Preliminary field investigations focussed on characterisation of the volcano-sedimentary sequence, loosely defining the extent and location of the mainly north-bounding granitoid and the South-bounding tonalite intrusive suites and assessing the overall geology and terrain in order to develop a comprehensive ground exploration programme. All samples were reasonably representative grabs taken with a geological hammer, with locations recorded using a handheld GPS.

Between the 23rd September and 3rd October, four areas were prospected, these being the West end of Bug Lake; central Bug Lake, South to Alcock Lake, and East Lower Bug Lake; North of Clear Lake, and an area between Stone Lake and Bug Creek in the north-east of the property.

Far eastern and north-eastern areas were accessed by road, boat and foot, with reasonably good access to the property. All other areas were accessed by float plane, using a cabin at the East end of Bug Lake as a base for traverses to the East and West.

A total of 28 samples were collected and upon completion of the programme, sent via Gardewine, Red Lake, to the Actlabs processing facility in Thunder Bay. Subsequently, the material was sent to Actlabs facility in Ancaster, Ontario for analysis. Gold results are generally at what is considered to be background level, with the highest assay being 24 ppb Au, 2 samples running 9 ppb Au and the rest being 5 or less ppb Au.

From 6th – 9th November, 2019, a high-resolution helicopter aeromagnetic survey was flown by Precision GeoSurveys Inc. of Langley, B.C., over a block of Red Lake Gold Inc.'s Whirlwind Jack property (Figure 1). The exploration expenditure for the aeromagnetic survey performed was \$142,800 (inclusive of applicable tax) (Figure 1).

A total of 2050.1 line km of magnetic data was collected over a total area of 92.8 km<sup>2</sup>. The survey was flown at 50 m line spacing at a heading of 000°/270°.

The magnetic equipment was a tri-axial magnetic gradient bird-type system, employed with a data acquisition system, laser altimeter, barometer, pilot guidance unit and GPS navigation systems. Two magnetic base stations were used to record temporal magnetic variations.

Survey data was transferred from the aircraft's data acquisition system onto a USB memory stick and copied onto a field data processing laptop. The raw data files in PEI binary data formation were converted into Geosoft GDB database format. Using Geosoft Oasis Montaj 9.7, the data was inspected to ensure compliance with contract specifications.

Final data processing including generation of digital data and maps was undertaken at the office of Precision GeoSurveys Inc., in Langley, B.C. (Walker 2019). The survey, maps and report were invoices at \$142,800.00.

The survey provided detailed information on stratigraphy and structure across the block (Figure 5).

Preliminary analysis of the magnetic data and correlation with regional mapping provides differentiation of the survey block into several domains, as described below:

**Domain A** represents widespread granodiorite, monzonite type intrusive activity, with weak to negligible partial supracrustal preservation.

**Domain B** represents tonalitic intrusive and gneissic rocks, with relict poorly preserved supracrustal material

**Domain C** represents a higher degree of preservation of supracrustal rocks within a tonalitic intrusive, gneissic region

**Domain D** represents significant magnetic intrusive rock preserved within a tonalitic gneiss terrain, characterised by amphibolitic units, and possible iron formations (graphite has been noted by government workers).

**Domain E** represents well-preserved supracrustal rocks within a broad East-West trending corridor. Monzonitic to granodioritic and granitic intrusive modification is variable.

Matt Long, P. Geo, a co-author, visited the Property January 30, 2020. The co-author snowshoed a quad/snowmobile trail from the Bug River boat launch area off highway 105 into the northeast portion on the property (446626E, 5641527N). The co-author could not identify any rocks due to the snow cover. The co-author completed a contract with the company September 23 to October 3, 2019 assisting Toby Hughes (Hughes 2019).

Figure 5. Red Lake Gold Airborne Magnetic Survey

**Item 10: Drilling**

Red Lake Gold has not yet performed any drilling of its own on the Property.

**Item 11: Sample Preparation, Analysis and Security**

All samples were grabs and deemed representative of the source exposures. Samples were tagged and sealed in the field, and upon completion of the programme, sent via Gardewine, Red Lake, to the Activation Laboratories Inc. (Actlabs) processing facility in Thunder Bay. Subsequently, the material was sent to Actlabs facility in Ancaster, Ontario for analysis.

The samples were analysed for Au and multi-element analysis, (ICP). Codes are as follows.

1A2-50-Tbay: QOP AA-Au (Au – Fire Assay AA)  
1E3-Tbay: QOP AquaGeo (Aqua Regia ICPOES)

Details on the preparation methods and analytical procedures can be found on the company website,  
<http://www.actlabs.com/list.aspx?menu=64&app=226&cat1=549&tp=12&lk=no>

Samples are of a prospective nature and may not fully represent the underlying geology. QA/QC data was provided by Actlabs as part of their quality control procedures. Their results are shown in the Appendix. There appears to be no anomalous results when comparing ICP analyses of the samples, with the standard, blank and duplicate material, and the author considers the results to be accurate.

**Item 12: Data Verification**

The authors implemented a data comparison of the assessment files available at the Ontario Ministry of Energy, Northern Development and Mines, and reports provided by Red Lake Gold. The Author has reviewed the assessment files referred to in this report. Assay certificates for drilling were not normally present prior to 1990 when the Ontario Mining Act was amended, requiring the inclusion of the certificates if they were used for assessment. The Author can verify that the information has been presented accurately as reported in those files and reports.

There were no limitations placed on the Author in conducting the verification of the data or the Property visit. The Author's opinion is that the data sets are adequate for the reliance on and completion of the Report.

**Item 13: Mineral Processing and Metallurgical Testing**

Red Lake Gold has not yet done any mineral processing studies or metallurgical testing on the Property.

**Item 14: Mineral Resource Estimates**

There is no mineral resource defined on the Property.

**Items 15 to 22 are for use on Advanced Properties, and since Red Lake Gold's Whirlwind Jack Property does not meet the criteria for Advanced Properties, these items are not included in this Report.**

**Item 23: Adjacent Properties**

The Dixie Project of Great Bear Resources is located adjacent to and immediately east of the Whirlwind Jack Property. The following data is sourced from Great Bear's website: <https://greatbearresources.ca/projects/red-lake-camp-ontario/dixie/>.

In July 2017, Great Bear entered into a purchase agreement with Newmont Mining to acquire Newmont's 33% stake in the project for \$80,000 in total cash payments over 4 years.

In September 2017, Great Bear acquired an additional 26 minerals claims and today the Dixie property covers 9,140 hectares.

In November 2018 Great Bear completed the purchase of 100% royalty -free interest in the Dixie Gold Project, Red Lake Ontario.

The Dixie property hosts two principle styles of gold mineralization:

**High-grade gold in quartz veins and silica-sulphide replacement zones (Dixie Limb and Hinge).** Hosted by mafic volcanic rocks and localized near regional-scale D2 fold axes. These mineralization styles are also typical of the significant mined deposits of the Red Lake district.

**High-grade disseminated gold with broad moderate to lower grade envelopes (LP Fault) is** interpreted to traverse the Dixie property for approximately 18 kilometres of strike length and currently drilled along 4 kilometres of strike length. High-grade gold mineralization is controlled by structural and geological contacts, and moderate to lower-grade disseminated

gold surrounds and flanks the high-grade intervals. The dominant gold-hosting stratigraphy consists of felsic sediments and volcanic units.

At the Dixie Project, gold mineralization is confirmed along a 2.3 km strike of a 10 km target. The system at the Dixie Project has a high-grade gold zone that includes recent intervals of 16.35 metres of 26.91 g/t gold and 7.00 metres of 68.76 g/t gold and is open along strike and at depth.

Combined with historical drilling, over 198 drill holes for 30,000 metres have been completed at the Dixie Project. In March of 2018 Great Bear commenced a 10,000 metre drill program, of which results from 5,000 metres in 23 holes had been reported as of August 2018. Press releases subsequently have indicated continual drilling to the date of this Report..

**The Authors have been unable to verify this information, and the information is not necessarily indicative of the mineralization on the Whirlwind Jack Property that is the subject of this Report.**

#### **Item 24: Other Relevant Data and Information**

The Author is unaware of any further data or relevant information that could be considered of any practical use in this Report. The Author is not aware of any material fact or material change with respect to the subject matter of the Report that is not reflected in the Report.

**Item 25: Interpretation and Conclusions**

The work completed to date on the property by previous operators and Red Lake Gold Mines is early stage. The property area is located in the western portion of the Uchi Subprovince, a region comprising two major greenstone belts, Red Lake and Birch-Uchi. Most of the previous work was focused on searching for base metals. The recent discoveries of gold mineralization on the Dixie Gold Project of Great Bear Resources has led to new geological understanding that has not been previously explored for on Red Lake Gold's property. The Property lies adjacent to and immediately west of the Dixie Project of Great Bear Resources Ltd.

The Whirlwind Jack Gold Project is a district-scale gold exploration project, and is viewed as sharing similar greenstone and geologic assemblages as the contiguous Dixie Gold Project being advanced by neighbouring Great Bear Resources.

In addition to significant geological likeness, past airborne geophysical work covering the Whirlwind Jack Gold Project has defined a similar and continuous geophysical footprint akin to the adjacent Dixie Project, with a long-length, arcing, magnetically disrupted trend visible across both properties.

Past exploration work at the mid-point of the Whirlwind Jack Gold Project has identified the presence of gold, including a historical grab sample of 7 g/t Au (see Mineral Deposit Inventory of Ontario, No. MDI52N04SE00057).

The airborne magnetics completed in the eastern portion of the property has define various Domains of rock types that provide targets for further exploration for possible gold mineralized environments.

As this Property is still a grassroots Property, with little previous exploration, there is always a substantial risk that the work proposed may not result in advancing the Property under current market conditions.

**Item 26: Recommendations**

Further prospecting and mapping on the Property is recommended to examine areas and targets in part defined by the airborne magnetic survey. This work should be followed up by soil geochemistry surveys over target areas determined by the above prospecting and mapping, as well as targets defined by the magnetic survey where outcrop is not found.

Induced Polarization (IP) surveys should be conducted over areas defined by the combined work discussed above, followed by diamond drilling on selected targets defined.

At this time the authors have not budgeted for diamond drilling, as it is not certain that suitable targets will be defined.

**26.1: Proposed Budget**

Mapping, Prospecting and Sampling	
Geologist for 14 days @ \$700/day .....	9,800
Technician/helper for 14 days @ \$300/day .....	4,200
14 days room and board for 2 @ 300/day .....	4,200
Transportation	
truck, gas	
14 days @ \$125/day .....	1,750
Soil Geochemical Sampling	
2 technicians for 14 days @ \$300/day .....	8,400
14 days room and board for 2 @ 300/day .....	4,200
Transportation	
truck, gas	
14 days @ \$125/day .....	1,750
Assays 200 @ \$35/sample .....	7,000
Line Cutting	
20 km @ \$900/km .....	18,000
Induced Polarization Survey	
20 km @ \$1500/km .....	30,000
Reports and Maps .....	5,000
Contingencies .....	<u>10,000</u>
<b>Total Proposed Budget</b>	<b>\$104,300</b>

**Item 28: Certificate of Qualifications****Desmond Cullen**

49 Husu Rd., R.R. #2  
Kaministiquia, Ontario  
Canada, P0T 1X0

Telephone: 807-633-6960, Fax: 807-622-4156

Email: desmond63@hotmail.com

**CERTIFICATE OF QUALIFIED PERSON**

I, Desmond Cullen, P.Geo. (#0164) do hereby certify that:

1. I am a consulting Professional Geologist living at 49 Husu Rd., R.R.#2, Kaministiquia, Ontario
2. I graduated with the degree of Honours Bachelor of Science (Geology) from Lakehead University, Thunder Bay, in 1988
3. "Technical Report" refers to the report titled "Technical Report on the Whirlwind Jack Property, Red Lake Mining Division, Northwestern Ontario" effective March 1, 2020.
4. I am a registered Professional Geoscientist with the Association of Professional Geoscientists of Ontario (#0164) and a member Ontario Prospectors Association.
5. I have worked as a Geologist for 30 years since my graduation from university.
6. I have read the definition of "qualified person" set out in National Instrument 43-101 ("NI 43-101") and certify that by reason of my education, affiliation with a professional association (as defined in NI 43-101) and past relevant work experience, I fulfill the requirements as a Qualified Person for the purposes of NI 43-101.
7. I have worked extensively in Northwestern Ontario, and also Indonesia, China and Mongolia since graduating University.
8. I have not visited the Whirlwind Jack Property.
9. I am responsible for Items 1-6, 9 -24 and complete editing Technical Report.
10. I am independent of the party or parties (the "issuer") involved in the transaction for which the Technical Report is required, other than providing consulting services, and in the application of all of the tests in section 1.5 of NI 43-101.
11. I have had no prior involvement with the mineral Property that forms the subject of this Technical Report.
12. I have read NI-43-101 and Form 43-101F1, and the Technical Report has been prepared in compliance with that Instrument and Form.

13. As of the date of this certificate, and to the best of my knowledge, information and belief, the Technical Report contains all scientific and technical information that is required to be disclosed to make the Technical Report not misleading.

Dated this 1st day of March, 2020.

## **CERTIFICATE OF QUALIFIED PERSON**

I, J. Garry Clark, P. Geo. (#0245), do hereby certify that:

1. I am the owner of Clark Expl. Consulting Inc. with an office at 941 Cobalt Crescent, Thunder Bay, Ontario.
2. I graduated with the degree of Honours Bachelor of Science (Geology) from Lakehead University, Thunder Bay, in 1983. I have written qualifying gold property reports for companies such as Discovery Harbour and Rainy River Resources both companies having gold potential on their properties.
3. "Technical Report" refers to the report titled " Technical Report on the Whirlwind Jack Property, Red Lake Mining Division, Northwestern Ontario" dated March 1, 2020.
4. I am a registered Professional Geoscientist with the Association of Professional Geoscientists of Ontario (#0245).
5. I have worked as a Geologist for 35 years since my graduation from university.
6. I have read the definition of "qualified person" set out in National Instrument 43-101 ("NI 43-101") and certify that by reason of my education, affiliation with a professional association (as defined in NI 43-101) and past relevant work experience, I fulfill the requirements as a Qualified Person for the purposes of NI 43-101 and am independent of the vendor of the property.
7. I am responsible for Items 25 to 26 and editing complete Technical Report, except for the Property visit..
8. I am independent of the party or parties (the "issuer") involved in the transaction for which the Technical Report is required and in the application of all requirements in Section 1.5 of N.I. 43-101.
9. I have had no other prior involvement with the mineral Property that forms the subject of this Technical Report.
10. I have read N.I. 43-101 and Form 43-101F1, and the Technical Report has been prepared in compliance with that Instrument and Form.

11. As of the date of this certificate, and to the best of my knowledge, information and belief, the Technical Report contains all scientific and technical information that is required to be disclosed to make the Technical Report not misleading.

## CERTIFICATE OF QUALIFIED PERSON

I, Matthew Long, P.Ge. (#1035) do hereby certify that:

1. I am a consulting Professional Geologist living at P.O. Box 544, Island EB2277, Red Lake, Ontario
2. I graduated with the degree of Honours Bachelor of Science (Geology) from University of Manitoba, Winnipeg, in 1997
3. "Technical Report" refers to the report titled "Technical Report on the Whirlwind Jack Property, Red Lake Mining Division, Northwestern Ontario" effective March 1, 2020.
4. I am a registered Professional Geoscientist with the Association of Professional Geoscientists of Ontario (#1035).
5. I have worked as a Geologist for 23 years since my graduation from university.
6. I have read the definition of "qualified person" set out in National Instrument 43-101 ("NI 43-101") and certify that by reason of my education, affiliation with a professional association (as defined in NI 43-101) and past relevant work experience, I fulfill the requirements as a Qualified Person for the purposes of NI 43-101.
7. I have worked extensively in Northwestern Ontario, Manitoba, and Nunavut since graduating University.
8. I have completed a property visit the Whirlwind Jack Property on January 30, 2020.
9. I am responsible for the Items 7 + 8 and editing the complete Technical Report.
10. I am independent of the party or parties (the "issuer") involved in the transaction for which the Technical Report is required, other than providing

consulting services, and in the application of all of the tests in section 1.5 of NI 43-101.

11. I have completed contract work Sept. 23 to Oct. 2, 2019 on the mineral Property that forms the subject of this Technical Report.

12. I have read NI-43-101 and Form 43-101F1, and the Technical Report has been prepared in compliance with that Instrument and Form.

13. As of the date of this certificate, and to the best of my knowledge, information and belief, the Technical Report contains all scientific and technical information that is required to be disclosed to make the Technical Report not misleading.

Dated this 1st day of March, 2020.

SIGNED

“Matthew Long”

---

Matthew Long, P.Geol.
